STRETCHING YOUR LICENSES TO THEIR LIMIT

What is Directory Sync?

OpenLM Directory Sync enables organizations to synchronize their OpenLM database with their primary directory service. Currently, this is possible for directories that use the LDAP protocol (e.g. Active Directory, ApacheDS, Novell eDirectory, Google Directory, Azure AD, AWS directory).

What can you do with Directory Sync?

See your end users

- ☑ Import the information you have on the organization's users and groups.
- ☑ Use OpenLM to clearly set the rules for who has access to which license and when.

Chargeback made easy

- ☑ Track software license usage according to user or group.
- ☑ Forget about a centralized budget for licenses.
- ☑ Allocate license utilization costs to the business unit(s) consuming them.

Automate license rules

- ☑ Let OpenLM do the heavy lifting.
- ☑ You set the stage by allowing or restricting license access.
- ☑ OpenLM will automatically apply the rules organization-wide.

Enrich usage reporting

- ☑ Access license utilization insights with ease.
- ☑ Find out which end user is utilizing which license and for how long.
- ☑ Visualize license utilization according to either to user or group.

FAQS

Is there any additional software I need to download besides activating the product in the Cloud Portal?

Yes. OpenLM's Directory Sync service has two components:

1. The Directory Synchronization Agent or DSA, which is a tiny piece of software you need to download.
2. The Directory Synchronization Service or DSS, which is a cloud service sending the data read by the DSA to the OpenLM Cloud server.

You can download DSA by clicking on this link.

What does the Directory Synchronization Service (DSS) do?

DSS allows creating sync definitions, manages Directory Synchronization Agents, and displays sync entities and their relationships. The Directory Synchronization Agent (DSA) will execute the sync definitions as received from the DSS.

Where does OpenLM store the information fetched from my organization's directory service?

OpenLM stores this data in a secure database in the cloud. OpenLM will use this information to help you monitor your end users' license usage.
